Synthesis and Characterization of Fullerene Nanowhiskers by Liquid-Liquid Interfacial Precipitation: ... reported for fullerene and fullerene derivatives in the solid state as well as in solution [1,2]. In addition to the solvated structures in various solvents, the morphologies like whiskers, nanotubes, fibers, disks, cones, etc., have been successfully obtained by various preparation methods ...

We show evidence of a relation between structure (mass) of asphaltene aggregates and interfacial properties (maximum amount at surface saturation), which implies a monolayer of aggregates which become denser at the surface.

Characterization of interfacial bonding strength has always been a very active research field for composite materials. Compared to the overall composite materials, the proportion of interface is relatively small and complex, which results in a great difficulty in measuring the performance of a separate interface.
